

# North Sea Region Climate Change Assessment - NOSCCA -

## NOSCCA

is an international initiative launched out of the scientific community to compile a comprehensive interdisciplinary and transdisciplinary assessment of the present scientific knowledge about all aspects of past, ongoing and future climate change in the greater North Sea region.

## Scope

The assessment will be based primarily on peer-reviewed published scientific work. Related impacts of climate change on marine and terrestrial ecosystems in the North Sea and adjacent areas will be predominately considered. Connected applied subject areas will include among others fisheries and coastal management.

The final product of NOSCCA will be a book released by a scientific publisher in 2014.

## Status

The international Scientific Steering Committee (SSC) has approved the NOSCCA plan during its first meeting in October 2010. The next step is to refine the structure of the assessment and to invite the chapter lead authors.
